## Executive Summary

Since 2001, the ASRT has conducted a wage and salary survey of radiologic technology professionals every three years. The primary objective of this ongoing study is to measure income, benefits, satisfaction, and other compensation-related metrics of radiologic technologists.

The ASRT Radiologic Technologist Wage and Salary Survey 2022 was made available in February 2022 to everyone with an email address in the ASRT database who did not list themselves as retired or a student. A total of 134,540 invitations were sent via e-mail to participate in the survey. At the close of the survey in late March, a total of 10,775 questionnaires had been completed, yielding a response rate of 8 percent.

All descriptive statistics are reported with data weighted by state and primary discipline in relation to the distribution of ARRT registrants across the country. This helps ensure that the results are representative of the R.T. population by these two factors, which significantly account for the compensation of technologists.

Verbatim responses to open-ended questions are available upon request.

## Compensation and Benefits

The mean annual full-time compensation for radiologic technologists across the nation and averaged over all disciplines was $\$ 77,027$.

- The states with the highest reported mean compensation across disciplines were California ( $\$ 114,123$ ), the District of Columbia ( $\$ 96,954$ ), and Massachusetts (\$92,285).
- States with the lowest reported mean compensation across disciplines were Nebraska (\$54,894), Alabama (\$60,891), and Arkansas $(\$ 63,233)$.
- The disciplines with the highest reported mean compensation were medical dosimetry ( $\$ 131,776$ ), breast MRI $(\$ 119,944)$, and radiologist assistant (\$117,763).
- The disciplines with the lowest reported mean compensation were radiography $(\$ 65,246)$, bone densitometry $(\$ 69,541)$, and vascular sonography (\$77,136).

Respondents were asked about the extent to which their employer helps to pay for their benefits and professional development.

- Respondents indicated that their employers were most likely to provide funding for a retirement plan ( $81.5 \%$ said their employer provided either a fixed percentage or all of the funding toward retirement) and for health insurance ( $74.7 \%$ said they receive either full or partial funding from their
employer). They were least likely to receive dental insurance, although a majority (65.4\%) indicated that their employer paid at least a portion of their dental insurance.
- Across the board, respondents received less employer funding for professional development than they did for traditional benefits. Tuition assistance was the form of professional development most frequently sponsored by employers, with $41.5 \%$ of respondents indicating that their employer provided full or partial funding; 25.5\% of respondents said their employer partially or fully funded continuing education requirements, and $21.5 \%$ said their employer provided funding for professional association dues.

Respondents were asked to rate their satisfaction with their compensation, including wage/salary, insurance/retirement benefits, and employer sponsorship of professional development:

- Overall, $46.6 \%$ of respondents were either very satisfied or satisfied with their wage or salary; another 21.1\% were neutral in their feelings about their compensation, and $31.2 \%$ were dissatisfied or very dissatisfied.
- Regarding their benefits (including professional development), $49.1 \%$ were either very satisfied or satisfied with their benefits, $32.4 \%$ were neutral, and $18.5 \%$ were dissatisfied or very dissatisfied.

## Demographics

The average radiologic technologist responding to the survey:

- Was 47.4 years old.
- Was female (78.0\%).
- Held an associate degree as their highest level of education (49.7\%).
- Was an ASRT member (99.3\%).
- Had worked in the radiologic sciences for 18.9 years and had worked at their current position for 10.1 years.
- Worked 40.2 hours per week (among those categorized as full-time) or 21.5 hours per week (among those categorized as parttime).
- Worked in a hospital ( $40.0 \%$ at a non-profit hospital, $15.2 \%$ at a for-profit hospital) with at least 500 beds (21.5\%).

Respondents were asked about their primary and secondary discipline and their job title:

- The six most common areas of practice among respondents were radiography (40.1\%), computed tomography ( $14.2 \%$ ), mammography (11.5\%), radiation therapy (10.9\%), magnetic resonance imaging (9.5\%), and vascular interventional radiography (3.1\%).
- The majority of respondents (65.7\%) had no secondary discipline; of the $34.3 \%$ who did practice a secondary discipline, the three most common areas of practice were radiography (37.4\%), computed tomography (22.5\%), and bone densitometry (17.5\%).
- The majority of respondents were staff technologists (69.0\%), 15.4\% were senior/lead technologists, and $5.5 \%$ were supervisors/managers.

## COVID-19 Questions

Respondents were asked several questions relating to how the COVID-19 pandemic had affected their facility.

- $29.3 \%$ of respondents had received additional compensation as a result of the pandemic.
- Those who received additional compensation were asked what type of compensation they received:
- $73.2 \%$ received a one-time bonus.
- $14.4 \%$ received ongoing bonuses such as hazard pay or similar.
- $9.8 \%$ received a larger-than-normal pay raise.
- $5.2 \%$ said they were receiving additional pay for the duration of the pandemic.
- $14.5 \%$ said they were receiving some other form of additional compensation.

Respondents were asked about how the pandemic had affected the number of hours they worked, and the staffing levels in their facility:

- $63.8 \%$ of respondents said they worked about the same number of hours they worked before; $29.1 \%$ said they worked more hours.
- $60.0 \%$ of respondents said their facility had fewer staff; $37.3 \%$ said staffing levels had remained roughly the same.

## Methodology

## Data Collection

An invitation to participate in the online survey was sent by e-mail in February 2022 to everyone with an email address in the ASRT database who did not list themselves as either retired or a student.

A random drawing to receive a $\$ 100$ gift card was offered as an incentive to those who completed the survey.

## Weighting

Appendix A (available upon request) shows the number of survey responses received from each state and primary discipline. Based upon these response distributions, a combined weight was computed to correct for under- and overrepresentation of states and disciplines.

Weights were computed as the ratio between the known population percentage of ARRTregistered R.T.s in each state and discipline and the observed percentage of R.T.s in the sample. Respondents who did not answer the state question were given a state weight of 1 in the weighted calculations. Likewise, respondents who did not report a primary discipline were assigned a discipline weight of 1.

Thus, the weighted results reported are the best estimates of the summary statistics that would have been obtained had 10,195 responses been collected at random from the entire database of active ARRT registrants.

## Primary Dependent Variable: Annualized

 CompensationCompensation data was collected as either a base annual salary or a base hourly wage. To simplify the reporting of this data, a base annual compensation figure was computed as a single compensation measure:

## Base compensation = base annual salary or 2080*(Base hourly wage)

To determine hourly wage = Annual compensation/2080 (or number of hours worked per year)

## Data Reliability

Responses were examined for logically impossible or implausible values of individual variables and for internally inconsistent responses across variable sets. Such implausible values were assigned a special code and omitted from computation of descriptive statistics. In particular, the following implausibility criteria were used:

- Number of years in the profession (radiologic sciences), in primary discipline, and in current position were considered implausible if the years in primary discipline were greater than the years in the radiologic sciences or if the years in current position were more than five years greater than years in the profession (allowing for those who held their current position while in a primary education program) or if the response implied the respondent entered the profession, the discipline, or their current position before age 15 .
- Base hourly wage was considered implausible if FTE wage was less than $\$ 8 /$ hour or greater than $\$ 200 /$ hour.
- Base annual salary was considered implausible if FTE wage was less than $\$ 17,000$, or a staff technologist FTE wage was greater than $\$ 200,000$; or staff, senior, lead, assistant chief, or chief technologist wage was greater than \$400,000.
- Approximate age (2022 - year of birth) was considered implausible if less than 16 or greater than 100.

## Margin of Error

A total of 10,195 radiologic technologists who are currently employed in the radiologic sciences responded to the survey. This sample size yields a $\pm 0.97 \%$ margin of error at its widest for overall percentages at the $95 \%$ confidence level.

The overall standard deviation of base annual compensation for the 9,033 full-time respondents is $\$ 24,599$. With this, the estimate of the mean base annual compensation of $\$ 77,027$ for these respondents has a $95 \%$ chance of being within $\$ 507$ of the actual population mean for all ARRT-certified R.T.s.

For percentages computed on subsets of respondents, the margin of error increases. Thus, the maximum margin of error for percentages based on a subset of 2,100 respondents would be $\pm 2.1 \%$ at the $95 \%$ confidence level. For a subset of 30 respondents, the widest margin of error would be $\pm 17.9 \%$. Finally, percentages based on a subgroup of only 10 R.T.s could have a margin of error as large as $\pm 31 \%$. Rather than ignoring results for smaller subgroups, the results are presented as respondents reported, yet figures may not be representative of the larger population.

Likewise, the margin of error for compensation also increases as subsets of the sample size decrease. This is offset somewhat by the tendency for the standard deviation to be smaller for subsets of R.T.s as reflected by their similar demographic. Ignoring that effect, the margin of error for the mean annual compensation of a random subset of 30 R.T.s could be as large as $\pm \$ 8,803$ at the $95 \%$ confidence level.

## essentia/research

## Annual Compensation

Annual Compensation = reported base annual salary or 2080*(reported base hourly wage)
Hourly Wage = annual compensation/2080 (or number of hours worked per year)
